The many aspects of the Sun Protection market

Sun Protection Products – Market Survey

Number of Launches of Sun Protection Products

Data from Mintel GNPD: <http://www.gnpd.com/sinatra/gnpd/frontpage/>

Seasonality of Sun Protection Products

Background

Glossary

- **SPF:** Sun protection factor, a number on a scale for rating the degree of protection provided by sunscreens. It is a ratio of the Minimal Erythral Dose on product protected skin (MED_p) to the Minimal Erythral Dose on unprotected skin (MED_u) of the same subject.

$$SPF = MED_p / MED_u$$

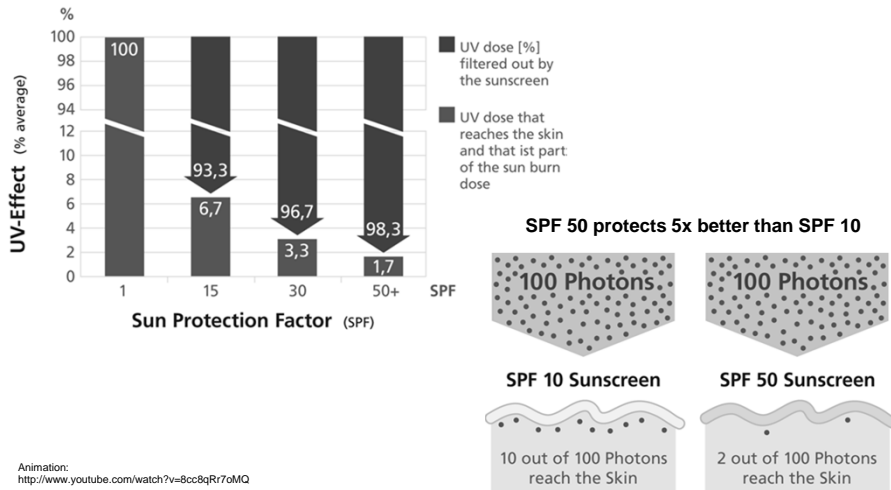

- **Absorption Spectrum and Transmission Spectrum**
- **Critical Wavelength (CW)** It tells consumers how far out (starting at the beginning of the UVB range) a product's 90% "protective umbrella" extends; The FDA has defined "broad spectrum" as products with a CW value of over 370nm.
- **UVA Protection:** UVA-PF/SPF ≥ 1/3(EU)

- ***In vivo, In vitro, In silico***¹

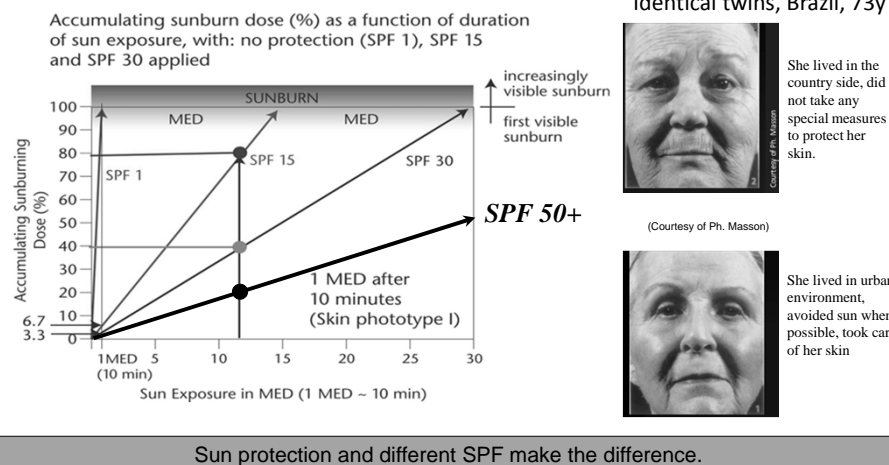

¹ Sun Protection In silico with BASF Sunscreen Simulator: www.basf.com/sunscreen-simulator

Background Spectrum of Natural Sunlight

(Courtesy Ch. Surber/SPIRIG)

Background

History of Sunscreens

1. "UVB sunscreens" ideally suited for tanning without sunburn.
2. Better UVA protection required.
3. Spectral homeostasis as the ultimate goal.

Background

Textiles provide uniform protection

Background

The Ideal Sunscreen

- Protects equally against UVB and UVA
- Reduces the quantity of the UV radiation
- Does not change the quality of the UV radiation that hits the skin

Spectral Homeostasis

= Neutral density filter

= Uniform UVB and UVA protection

The sun and UV radiation are not the problem; too much of them is the problem.

Gavin Greenoak

Background

The most widely used absorbers for UVB and UVA

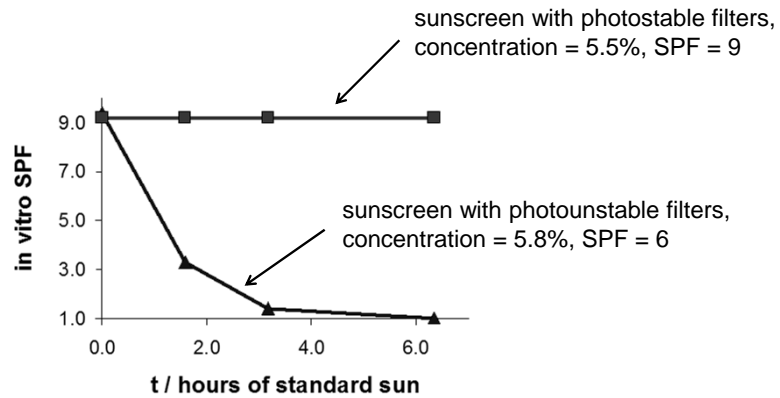

Problem: Combination EHMC/BMBM is not photostable

Background

Photostability (related to efficacy and safety)

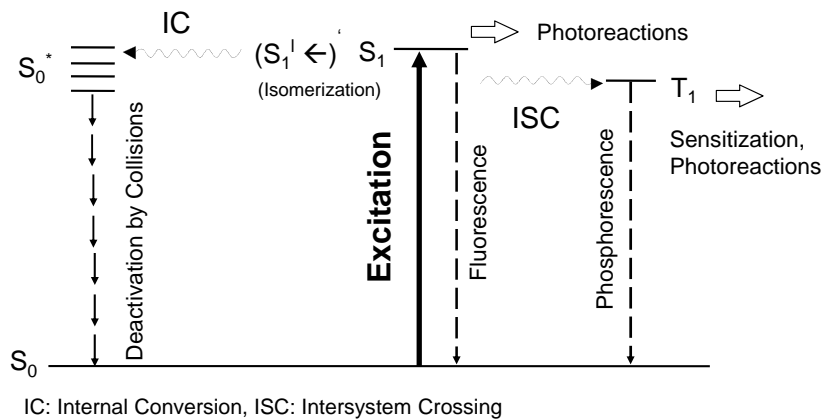

UV-absorbers are photo-unstable, if their chemical structure changes irreversibly upon irradiation.

Background

Mechanism of UV Absorption

Processes after excitation in organic molecules

Background

Mechanism of UV Filter

Background

The Four Basic Requirements (4BR)

1. Efficacy	Sunscreen actives (UV Filters) must absorb UV radiation somewhere between wavelengths of 290 and 400 nm. The specific Extinction $E_{1,1}$ is a measure of maximum absorption by weight (extrapolated for 1% concentration and 1 cm path length). The value of a UV filter is determined by its contribution to the SPF and UVA-PF.
2. Safety	Sunscreen actives should have no adverse effect on humans and the environment. Although direct comparison with a new pharmaceutical drug is not appropriate, the development of a new sunscreen active for global use is highly demanding.
3. Registration	In order to exploit the full economic potential of a UV filter, UV absorber manufacturers are aiming for global registration. In Europe, South America, Asia and Africa, where sunscreens are considered as cosmetics, approval is possible within 1-2 years of filing. In Australia, Japan and especially the USA it takes longer.
4. Patent Freedom	Patent freedom means the free use of sunscreen actives by any sunscreen manufacturer, i.e. without any uncertainty about whether any third party patent rights are infringed by the use of a particular ingredient.

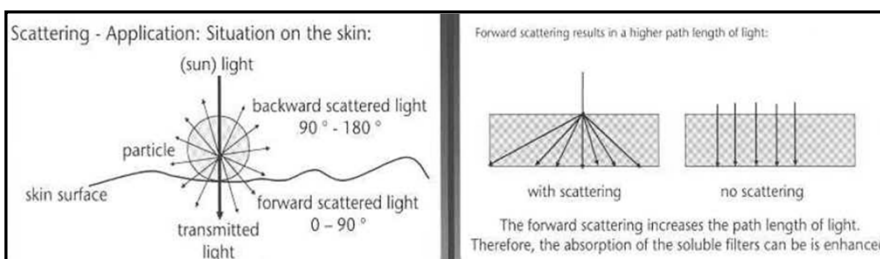

Background

Trends for improving photostability

- **Photo-stabilization** of BMBM (Avobenzone) by
 - Octocrylene, MBC, MBBT, BEMT, DHHB or
 - Diethylhexyl 2,6 Naphthalate (DEHN, CORAPAN® TQ)
 - Diethylhexyl Syringylidene Malonate (DESM, OxyneX® ST)
 - Benzotriazolyl Dodecyl p-cresol (TINOGARD® TL)
- **Stabilization of TiO₂** (Coating, Manganese)
- **Encapsulation** of UV Filters, e.g. UV-Pearls™ EHMC. Reaction of EHMC with BMBM thus is not possible
- **Use of New UV filters with inherently high photostability**

Background

Scattering of Particles (Organic and Inorganic)

Reflection = backwards scattered UVR and Light
= about 5 -15% contribution, depending on particle size

S. Mueller, B. Herzog, J. Giesinger, K. Quass, U. Osterwalder, Micronization as tool in the development of innovative UV filters SÖFW Journal, July 2005

Smaller particles are more efficient in absorption (but less in scattering)
With too big particles, the UV may be blocked inside, and part of the absorbing material will stay unused.

Efficient particles are smaller than 200 nm

First UV Filter on Appendix VI as nano-form:

Tris-Biphenyl Triazine (nano)

SCCS/1429/11
Revision of 13/14 December 2011

Directorate-General for Health & Consumers

Scientific Committee on Consumer Safety
SCCS

OPINION ON
1,3,5-Triazine, 2,4,6-tris[1,1'-biphenyl]-4-yl-

...it was concluded that the use of 10% ETH50 can be considered safe for dermal application.

INCI: Tris-Biphenyl Triazine (TBPT)
A new microfine organic particles UV filter

SCCS/1429/11, Revision of 13/14 December 2011

The majority of the particles are below 100 nm, but also structures larger than 100 nm can be observed.

New UV Filter: Tris-Biphenyl Triazine (nano), TBPT

Influence of particle size on efficacy

- Absorption in UVAII and UVB region increases with the decreasing particle size
- Larger particles are less efficient and less transparent (i.e. visible)

SCCS/1429/11, Revision of 13/14 December 2011

22

Sunscreen Actives (Summary)

Osterwalder U and Herzog B, Chemistry and Properties of Organic and Inorganic UV Filters, Clinical Guide to Sunscreens and Photoprotection, edited by HW Lim and ZD Draelos, informa healthcare, New York 2009

BASF's approach:

"Closing the gaps" in UV-A protection

Hueglin, BASF Research Press Conference, Ludwigshafen, March 29, 2012

UV Filters

Time frame to achieve global approval (especially USA)

Hopefully it will take less than 20 years to achieve full global approval for the new broad-spectrum UV filters

UV Filters

Risk Assessment - Humans and Environment

RISK = EXPOSURE x HAZARD

◆ Exposure: Humans, Environment

(defined by application, use pattern, physico-chemical properties, specific preparations ...)

➡ can be modified

◆ Hazard:

(defined by toxicological / ecotoxicological profile)

➡ cannot be modified ➡ inherent properties

Potential risks should be compared with benefits of sun protection

UV Filters

EU: Safety Requirements

Data on the compound, specification, analytical methods, stability and photostability, and safety include:

Dossier preparation	<ul style="list-style-type: none"> • Acute oral toxicity • Acute dermal toxicity • Repeated dose oral toxicity • Irritation (skin) • Irritation (mucous membranes) • Sensitisation • Dermal absorption • Teratogenicity 	<ul style="list-style-type: none"> • Mutagenicity/Genotoxicity • Phototoxicity; Photoallergenicity • Photomutagenicity • Safety evaluation • Additional studies depending upon the results of the dermal absorption test and the outcome of the other studies <p>Note: endocrine effects are evaluated in vivo from affected systems; e.g., in Teratology study sex ratio or ano-genital distance.</p>	approx. 2 years costs 350.000 to 400.000 € per compound
----------------------------	---	---	---

Approval process	<ul style="list-style-type: none"> • Application for inclusion in Annex VII of Dir. 76/768 EEC (2013-07:Annex VI) • Safety evaluation by SCCP (Scientific Committee on Consumers Products) • Ad-hoc Working Party proposes new Adaptation to Technical Progress (ATP) Directive • Committee of ATP agrees • Publication in Official Journal 	1-2 years

UVA XX coverage (%)	10	%	5	15

SPF
SPF (international method): 43.1
Rating: 30

Comparison of Real Simulation and Real-Life Results

Real-Life Calculations
SPF (Real-Life): 29.9
Rating: 30

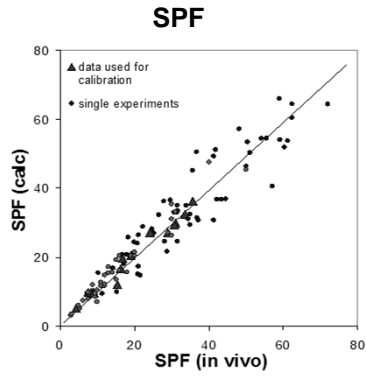

www.basf.com/sunscreen-simulator

Reducing time to market by rapid prototyping:

- Explore formulation space to develop different sunscreens
- Check UVA protection metrics of all major regions
- Check photostability and closeness to ideal sunscreen
- Test *in silico* before expensive *in vitro* or *in vivo* testing

In Silico Assessment

Reliability of BASF Sunscreen Simulator

n = 110, slope = 0.98, r = 0.958

n = 81, slope = 1.13, r = 0.948

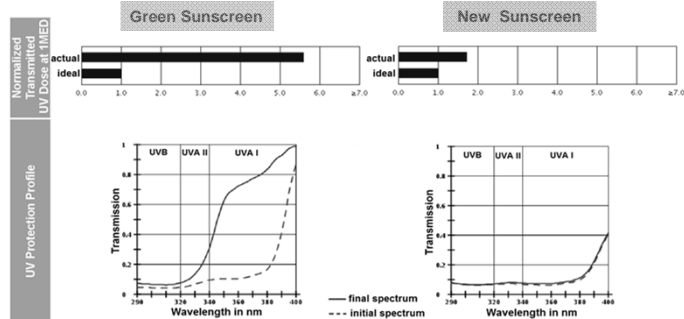

In silico does not replace actual formulation work and *in vivo* SPF testing of the final product

In Silico Assessment

Example by using BASF Sunscreen Simulator

Product	Active ingredients (%)						Total
	UVB / UVA2			UVA 1 / Broad spectrum			
	EHMC	OCR	PBSA	BEMT	BMBM	MBBT	
Green Sunscreen	8				2		10,00
New Sunscreen		2	1	1.5	1.5	1.5	7.5

SPF 15

The same SPF may lead to completely different UV exposure

Outlook

US-FDA, Final Rule, 2011-06-17

Drug Facts	
Active Ingredients	Purpose
Azobenzene 3% Homosalate 10% Octyl methoxycinnamate 7.5%	Sunscreen
Uses	
<ul style="list-style-type: none"> • helps prevent sunburn • If used as directed with other sun protection measures (see Directions), decreases the risk of skin cancer and early skin aging caused by the sun 	
Warnings	
For external use only	
Do not use on damaged or broken skin	
When using this product keep out of eyes. Rinse with water to remove.	
Stop use and ask a doctor if rash occurs	
Keep out of reach of children. If product is swallowed, get medical help or contact a Poison Control Center right away.	
Directions	
<ul style="list-style-type: none"> • Apply liberally 15 minutes before sun exposure • Reapply: <ul style="list-style-type: none"> • after 40 minutes of swimming or sweating • immediately after towel drying • at least every 2 hours • Sun Protection Measures. Spending time in the sun increases your risk of skin cancer and early skin aging. To decrease this risk, regularly use a sunscreen with a broad spectrum SPF of 15 or higher and other sun protection measures including: <ul style="list-style-type: none"> • limit time in the sun, especially from 10 a.m. – 2 p.m. • wear long-sleeve shirts, pants, hats, and sunglasses • children under 6 months: Ask a doctor 	
Inactive ingredients	
Aloe extract, barium sulfate, benzyl alcohol, carbomer, dimethicone, disodium EDTA, jojoba oil, methylparaben, octadecane/MA copolymer, polyglycol-3 dibenzoate, phenethyl alcohol, propylparaben, sorbitan isostearate, sorbitol, stearic acid, tocopherol (vitamin E), triethanolamine, water	
Other information	
* avoid this product from excessive heat and direct sun	
Questions or comments?

- Background
- New UV Filters
- UVA Protection
- *In silico* assessment
- Outlook
- Conclusion

Conclusion

- **New UV filters that came to market in the last decade that allow manufacturing of photostable sunscreens with good UVA protection**
- **Latest positive opinion for UV filter TBPT – UVB & UVA II range with high effectiveness**
- **CW 370 does not provide sufficient UVA protection**
- ***In silico* method helps understanding sunscreens and helps accelerate innovation**

Public Access to SunScreens (PASS) Coalition

- ▶ The PASS Coalition is a multi-stakeholder coalition formed to advocate for a transparent and timely review by the U.S. FDA of over-the-counter sunscreen ingredients.
- ▶ On a bipartisan, bicameral basis, Congress enacted reforms to the U.S. sunscreen application process to expedite the approval of new and innovative sunscreen ingredients. The *Sunscreen Innovation Act* (Public Law 113-195) amends the Food Drug & Cosmetic Act to ensure all sunscreen ingredients receive a transparent and timely review.
- ▶ Despite this legislation, the U.S. Food and Drug Administration (FDA) has yet to make a final decision on eight pending sunscreen ingredients that have been awaiting review for up to 13 years in some cases.
- ▶ On May 22, a petition to President Obama was filed calling for action to fight skin cancer and ensure access to the latest sunscreens. The petition can be accessed here: <http://wh.gov/IKss3>

US Registration Understanding the FDA

Reasons for delay of US approval:

- Not protectionism (urban legend)
- Regulated as OTC drug
- **Thalidomide**
 - One scientist at FDA avoided damage in US
 - **Paradigm change at FDA**

Europe: Early 60's

Reasons for delay of US approval: *Thalidomide*

50 Years after Thalidomide: Why Regulation Matters

Posted on February 7, 2012 by FDA_Voice

By: Margaret Hamburg, M.D.

Fifty years ago, the vigilance of FDA medical officer Dr. Frances Kelsey prevented a public health tragedy of enormous proportion by ensuring that the sedative thalidomide was never approved in the United States. As many remember, in the early 1960's, reports were coming in from around the world of countless women who were giving birth to children with extremely deformed limbs and other severe birth defects. They had taken thalidomide. Although it was being used in many countries, Dr. Kelsey discovered that it hadn't even been tested on pregnant animals.

Dr. Kelsey's reaction to thalidomide exemplifies the FDA's mission: protecting and promoting the health of the American people, using science for regulatory decision-making.

1962: Frances Kathleen Oldham Kelsey receiving the President's Award for Distinguished Federal Civilian Service from President John F. Kennedy

Kelsey (age 87) at the FDA Reception commemorating her induction into the National Women's Hall of Fame

Legacy and awards

- 1962 - President's Award for Distinguished Federal Civilian Service^[1]
- 1963 - Gold Key Award from University of Chicago, Medical and Biological Sciences A
- In 1994, the Frances Kelsey Secondary School in Mill Bay, British Columbia is named i
- 2000 - Inducted into the National Women's Hall of Fame^[2]
- 2011 - Named a Visual Mentor for the American Medical Association^[3]
- 2006 - Foremother Award from the NRC for Women & Families^[4]

In 2010 the FDA honored Kelsey by naming one of the awards, Center Director Steven K. Galson, M.D. Kelsey Drug Safety Excellence Award and to recog important aspect of drug regulation.^[5] Kelsey rece annually.^[6] Kelsey received an honorary doctor of science deg Kelsey named 100 in July 2014.^[7] Asteroid 6260 Kelsey is named in her honour.^[8]

'Shedding some light on FDA's review of sunscreen ingredients and the Sunscreen Innovation Act

Posted on February 24, 2015 by FDA Voice

By: Theresa M. Michele, M.D.

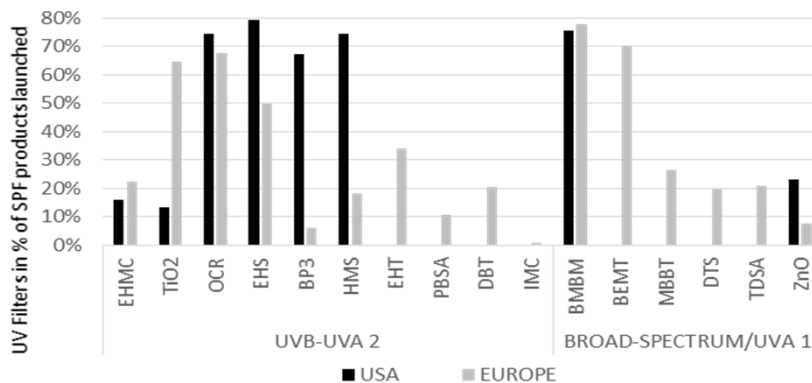

At this time there is not enough generally available data to determine whether any of the ingredients under review meet FDA's safety and effectiveness standards.

Successful implementation of the SIA will require a cooperative effort with industry and other stakeholders. We look forward to continuing this important work.

UV Filter use USA vs Europe
